AUTOSAT

SEMI AUTOMATIC/BATTERY-POWERED MACHINE

Autosat® is a machine able to move independently and destined for the automatic storage of pallets, in a traditional drive-in shelf of the lane.

Autosat® guarantees an automatic high-density storage, allowing the maximum exploitation of the stock volume. It demonstrates its effectiveness in the event of repeated draining/filling of the same channel (e.g., buffer zone management).

Depending on your needs, the machine is available in two versions:

- **Autosat®**: controlled by a simple multi-function remote control with LED display
- **Autosat® wifi**: controlled via wifi with WMS communication (Warehouse Management Software) between PDAs and AGV laser-guided shuttles

Automha Shuttle is branded in USA and Canada, **PalletRunner**

Automha.
